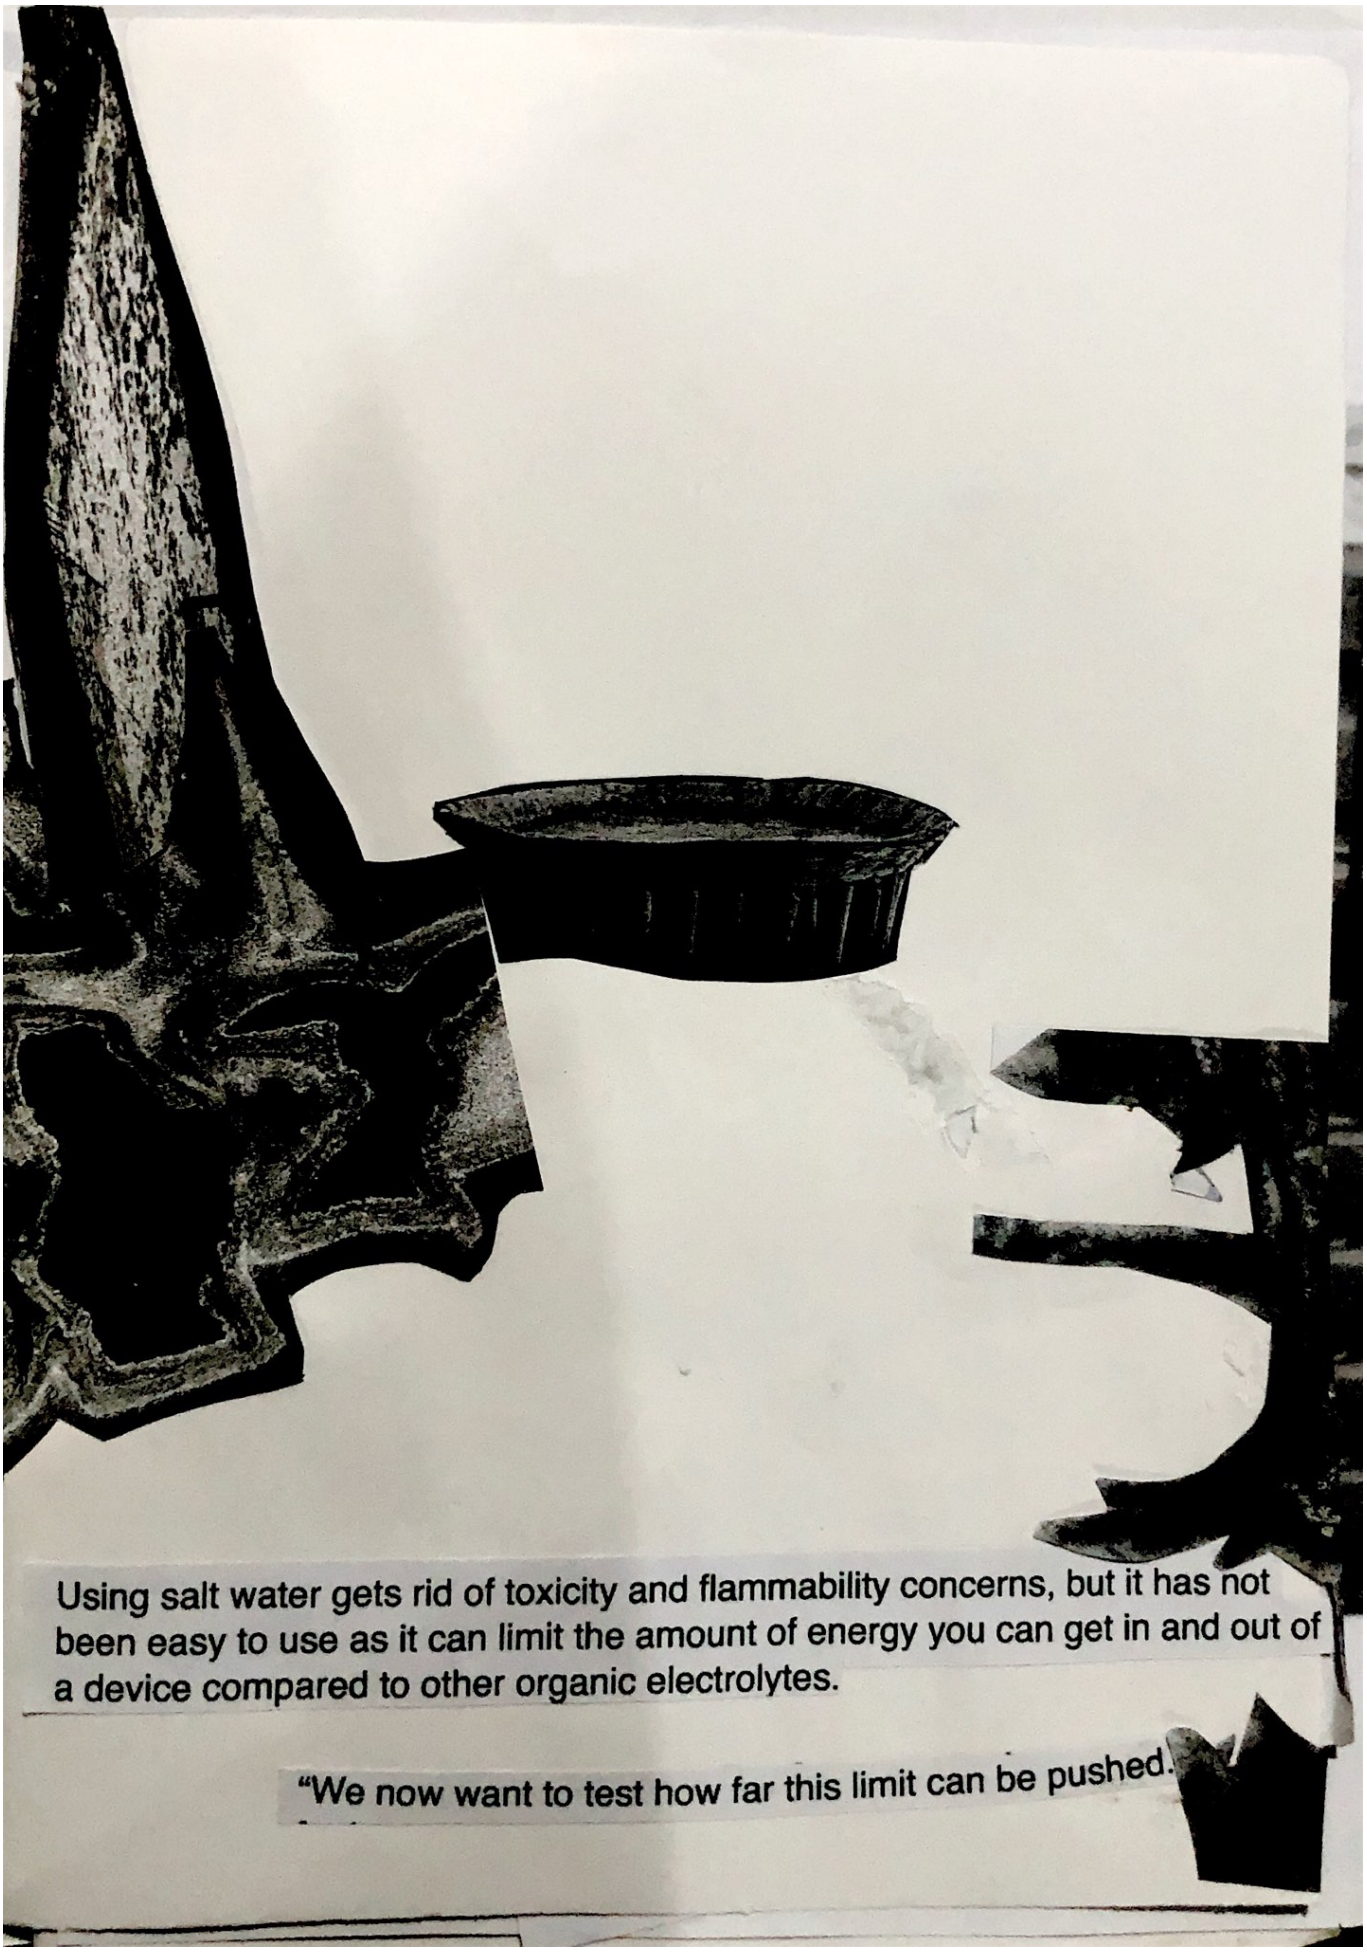
SEA

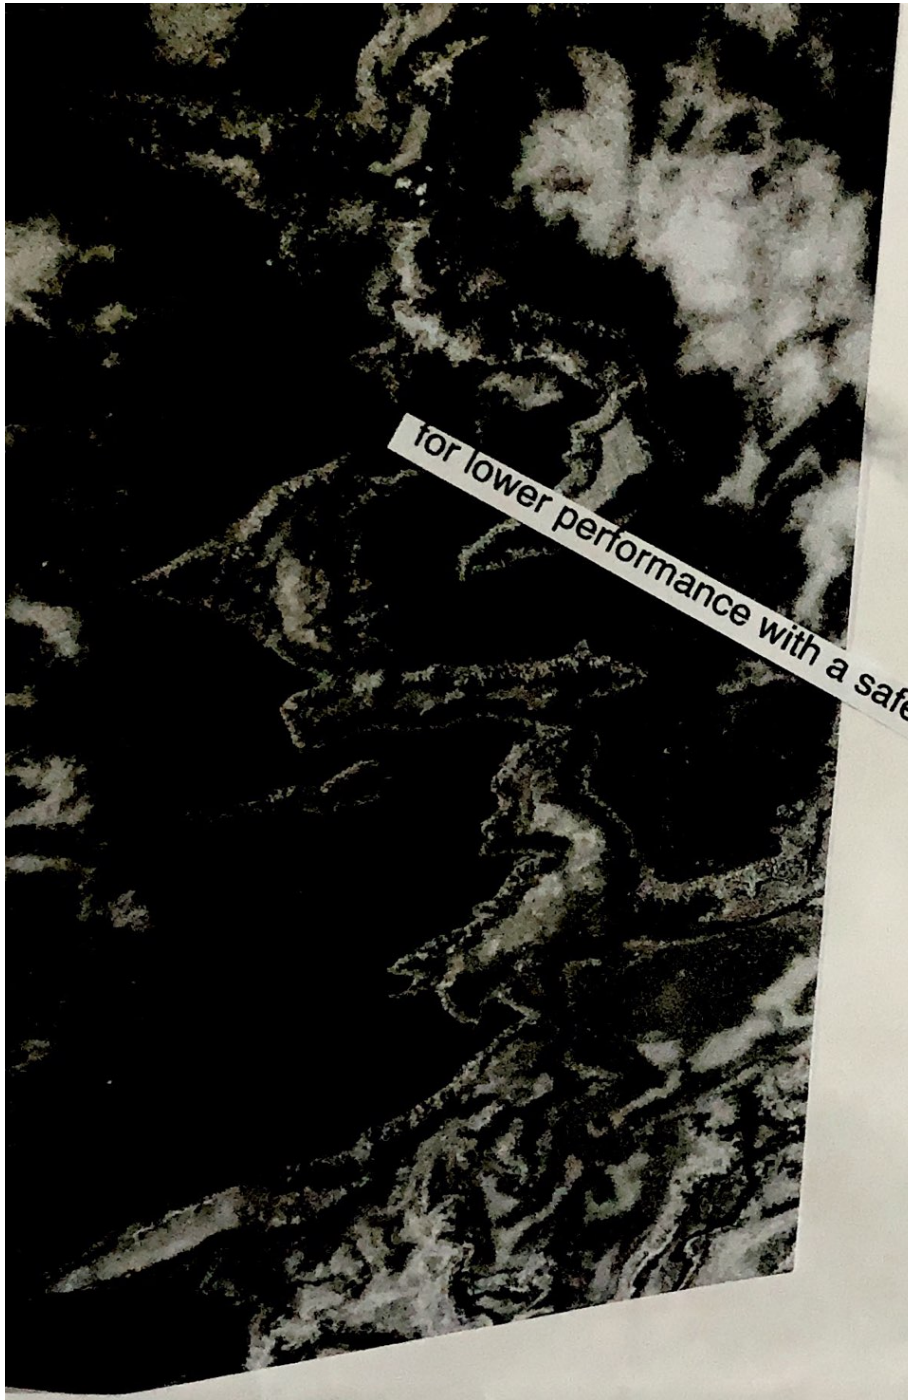
A slow slope that starts right from the coast and climbs up toward

A battery prototype has been designed using salt water and materials that are non-toxic and charge quickly, paving the way for new types of battery.



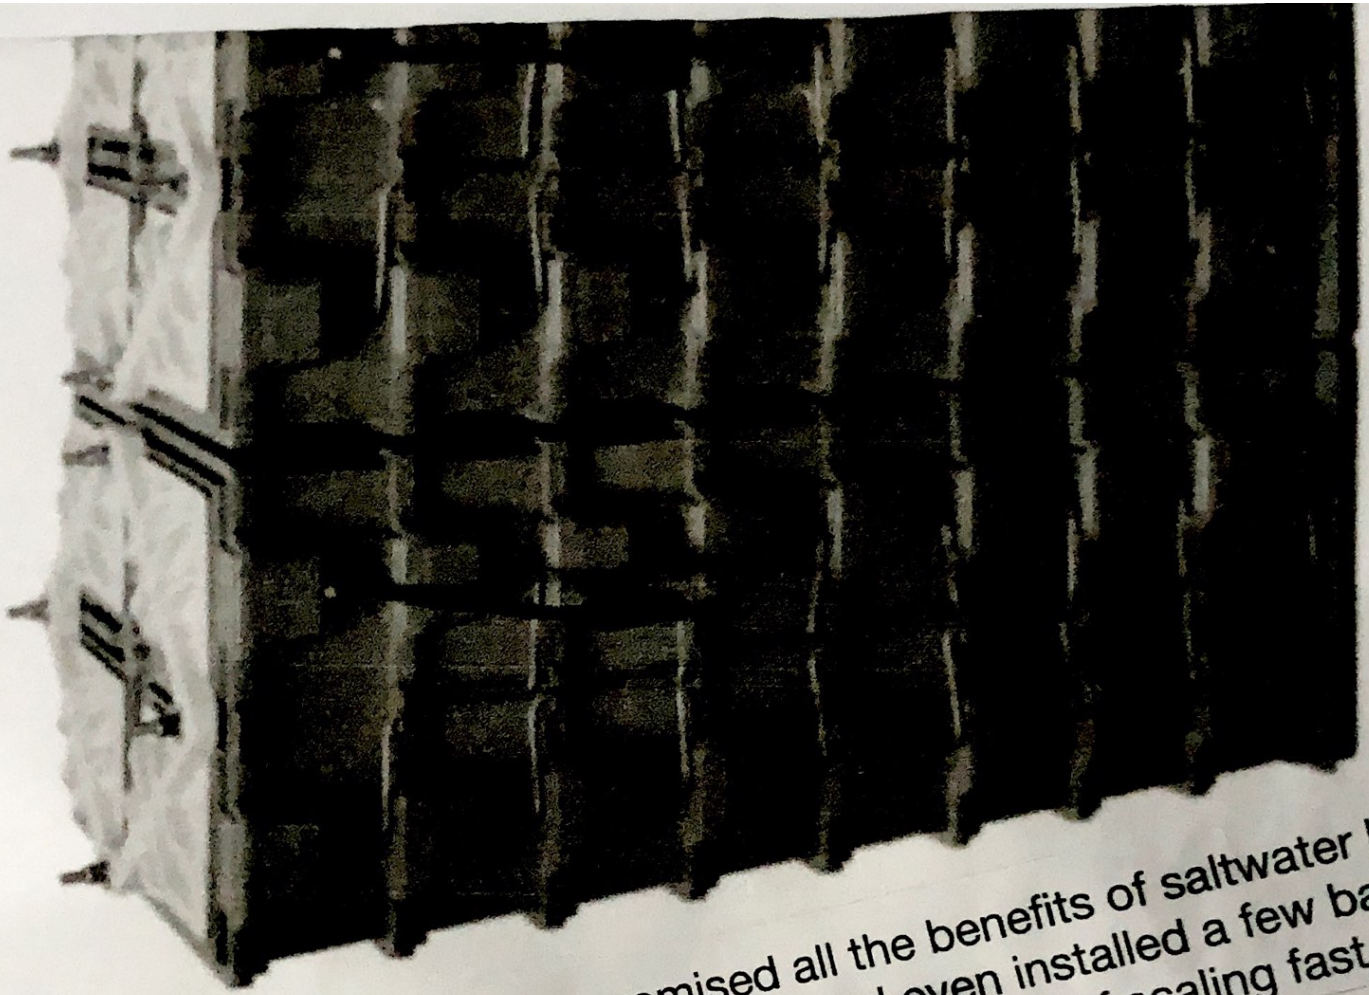
Using salt water gets rid of toxicity and flammability concerns, but it has not been easy to use as it can limit the amount of energy you can get in and out of a device compared to other organic electrolytes.

"We now want to test how far this limit can be pushed.



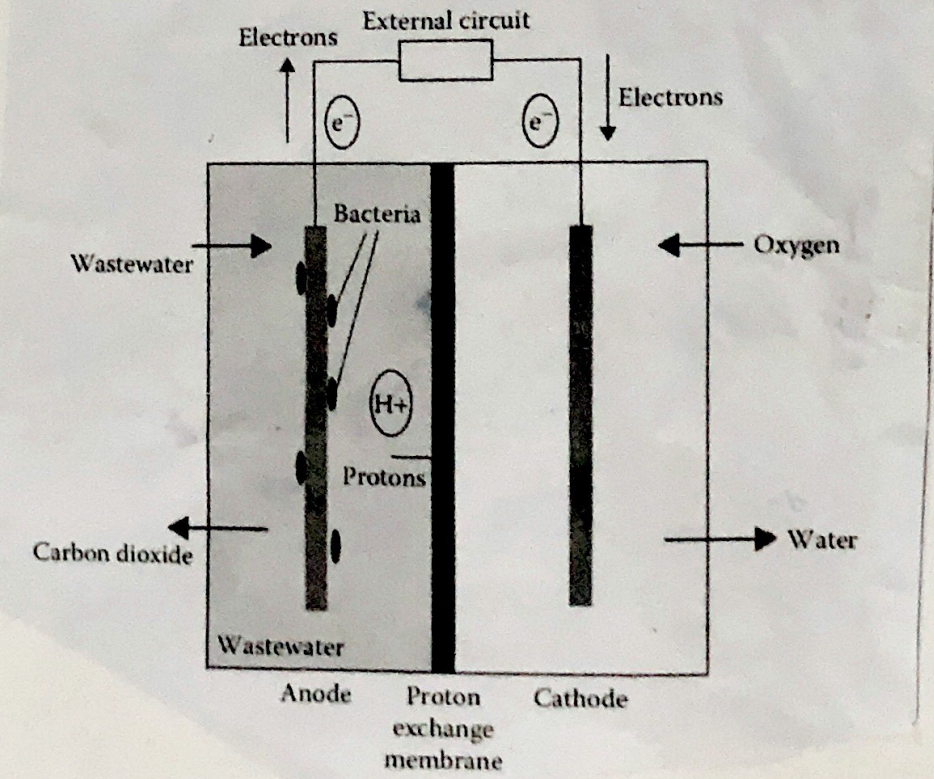
for lower performance with a safer combination of materials,

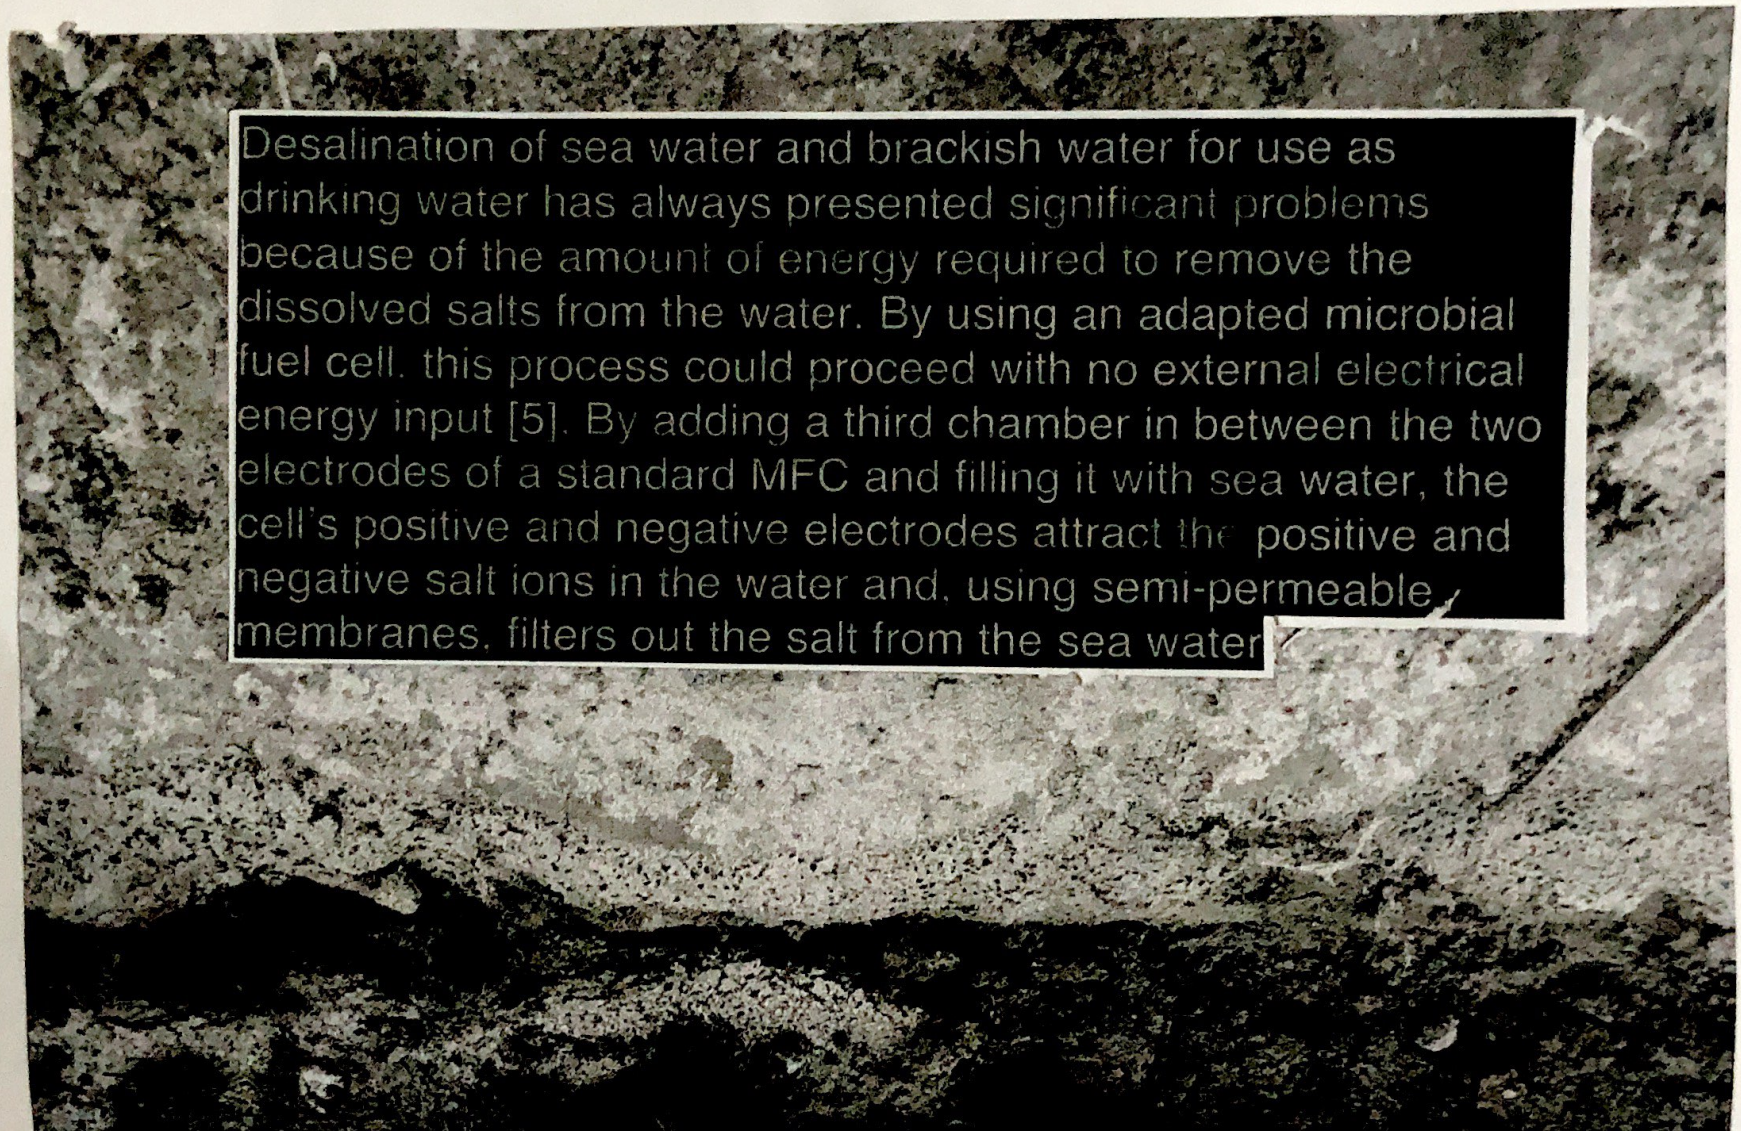
We have compensated



Aquion promised all the benefits of saltwater batteries mentioned above and even installed a few battery systems before the financial challenge of scaling fast enough took down the company.

Fig. 6. A simple microbial fuel cell consisting of a cathode attached to an anode by a metal wire. By placing the anode in the anaerobic sediment of a river or ocean and placing the cathode in the aerobic water right above the sediment, a current is generated. areas.





Desalination of sea water and brackish water for use as drinking water has always presented significant problems because of the amount of energy required to remove the dissolved salts from the water. By using an adapted microbial fuel cell. this process could proceed with no external electrical energy input [5]. By adding a third chamber in between the two electrodes of a standard MFC and filling it with sea water, the cell's positive and negative electrodes attract the positive and negative salt ions in the water and. using semi-permeable membranes. filters out the salt from the sea water

One major advantage of using a microbial fuel cell in remote sensing rather than a traditional battery is that the bacteria reproduce, giving the MFC a significantly longer lifetime than traditional batteries [2]. The sensor can thus be left alone in a remote area for many years without maintenance.

but improving the performance could open up the path to whole new types of viable energy storage devices that are also safe and sustainable."
